GEO CRM / Finance

Operator guide

GOST 19.505 structure / English adaptation

RELEASE	1.4.0-demo
LANGUAGE	International English
CURRENCY	USD / US dollars
PROFILE	Same local application / Graphite

36	19	17
tests passed	tables retained	native screens

1. Purpose and scope

This operator guide covers Expense requests and Liquidity in GEO CRM 1.4.0-demo, International English/USD. It follows the main organisational headings of GOST 19.505-79; it is an English adaptation, not a formally approved ESPD document or a conformity audit.

Requests record an intended expense, route approvals and store a manually recorded payment fact. Liquidity combines expected receipts, separate planned payments and open requests into a 91-day/13-week model. It shows potential cash gaps under changed assumptions; it does not operate a bank account.

Role	Main actions
Applicant / sales manager	Create a request; edit own draft; inspect own requests.
Finance director / administrator	Review requests, approve or schedule; maintain liquidity inputs.
Director	Approve above-limit requests; read/model liquidity.
Accountant	Record payment or return a scheduled request; read/model liquidity.

Synthetic account details are in application/README.md. The data is fictional; the main local URL is http://localhost: 8765.

2. Operating conditions

Use the existing running local application, or install the source dependencies and PostgreSQL as described in application/README.md. A bundled snapshot is installed with run.py demo only into an empty database; existing data is never overwritten. Later use start/stop. The snapshot horizon begins 2 Nov 2026; fresh seed dates follow its creation date.

All monetary fields are USD. Enter decimal amounts such as 1250.00. Equipment remains metric. Displayed dates use day, English month and year. A native date input may follow the browser's own input convention; inspect its selected date before saving.

Above USD 1,000, the director approval is needed before finance approval. USD 1,000.01 is above the boundary, exactly 1,000 is not. Standard planned payment day: Tuesday. Urgent requests may also use Thursday. Before 10: 00 on an allowed day that date is eligible; at or after 10: 00 the next allowed day is proposed. The clock is the local server clock.

No accounting/bank integration, file upload, currency conversion or automatic opening-cash reconciliation is provided. Document attachments are links. A recorded payment is a manual fact, not a bank instruction.

3. Executing request operations

Create: open Expense requests -> Create request. Enter title, positive USD amount, expense category, payee, due date and invoice/contract link. Link a deal where the category requires one; use the internal company for an internal expense. Mark urgent only when appropriate. Save and verify the new draft and history.

Approve: the director records approval first when the amount is above the limit. The finance director then approves the request. Schedule: finance chooses Schedule for payment; review the proposed payment date. The calendar is a planning rule, not a mechanism preventing a later manual recording at another time.

Record payment: the accountant opens a scheduled request, confirms the intended action and records payment. Verify Paid and the history. There is no automatic matching to bank statements. The corresponding open obligation then leaves the live liquidity inputs; an already-saved forecast remains unchanged.

Return/reject: eligible financial roles may return a scheduled request to Approved or reject according to the visible action. Review the resulting state. Existing limitation: return-comment validation/persistence is incomplete; do not rely on that field as a complete audit record. Contact the process owner for unresolved self-approval policy.

Keep an obligation in exactly one source. Adding a manual forecast payment for a request already included by ID duplicates the expense and distorts the result.

3. Executing liquidity operations

1. Open Liquidity -> Source data. Check forecast start, opening cash and target reserve. Finance director/admin may edit these. Add each expected customer receipt as an amount/date/assumption; deal value alone is not a receipt.

2. Check the request-derived payments. Approved uses due date; Scheduled uses payment date. Paid/Rejected are excluded. Drafts enter only through the explicit scenario option. Manual flows enter only in Planned status. Open overdue flows are placed on day one as a stated assumption.

3. Open Overview. Select No delay, then Calculate. Compare with 30 days or a selected customer. Changing a control creates a draft; Calculate applies it. Use minimum daily balance, first cash gap, funding to zero and funding to reserve. Baseline is dashed, scenario solid; red and a minus sign indicate negative cash.

4. Open Cash plan and choose a week for daily detail. Follow source names/IDs. In the bundled default 30-day scenario, week 11 has -USD 1,650 minimum but +USD 550 closing balance. USD 16,800 receipts fall beyond the horizon; they are not written off.

5. Additional assumptions can reduce receipts, defer explicitly optional manual payments or inject opening funding. These are conditional measures, not approvals or executed transactions. Save forecast captures inputs and results. Open it in Saved forecasts; subsequent source edits do not rewrite the saved snapshot.

4. Messages and recovery

Observation	Action
Director approval required	For an above-limit request, obtain director approval before finance approval.
Required field / invalid amount / date	Correct the highlighted input; use a positive amount and a valid selected date.
Forbidden / action unavailable	Check role and record ownership; do not treat a hidden button as server authorisation.
Cash gap warning	Inspect daily detail, sources and assumptions; compare conditional measures and recalculate.
Inputs changed	Select Calculate; the previous result otherwise still represents the previous assumptions.
Model uninitialised / service unavailable	Confirm the local service is running and the demo data has been installed. Use README instructions; avoid resetting a populated database.

For unexpected behaviour, record release, role, record ID, selected assumptions and visible message. Keep the source data. Request a technical review rather than silently deleting/re-entering records.

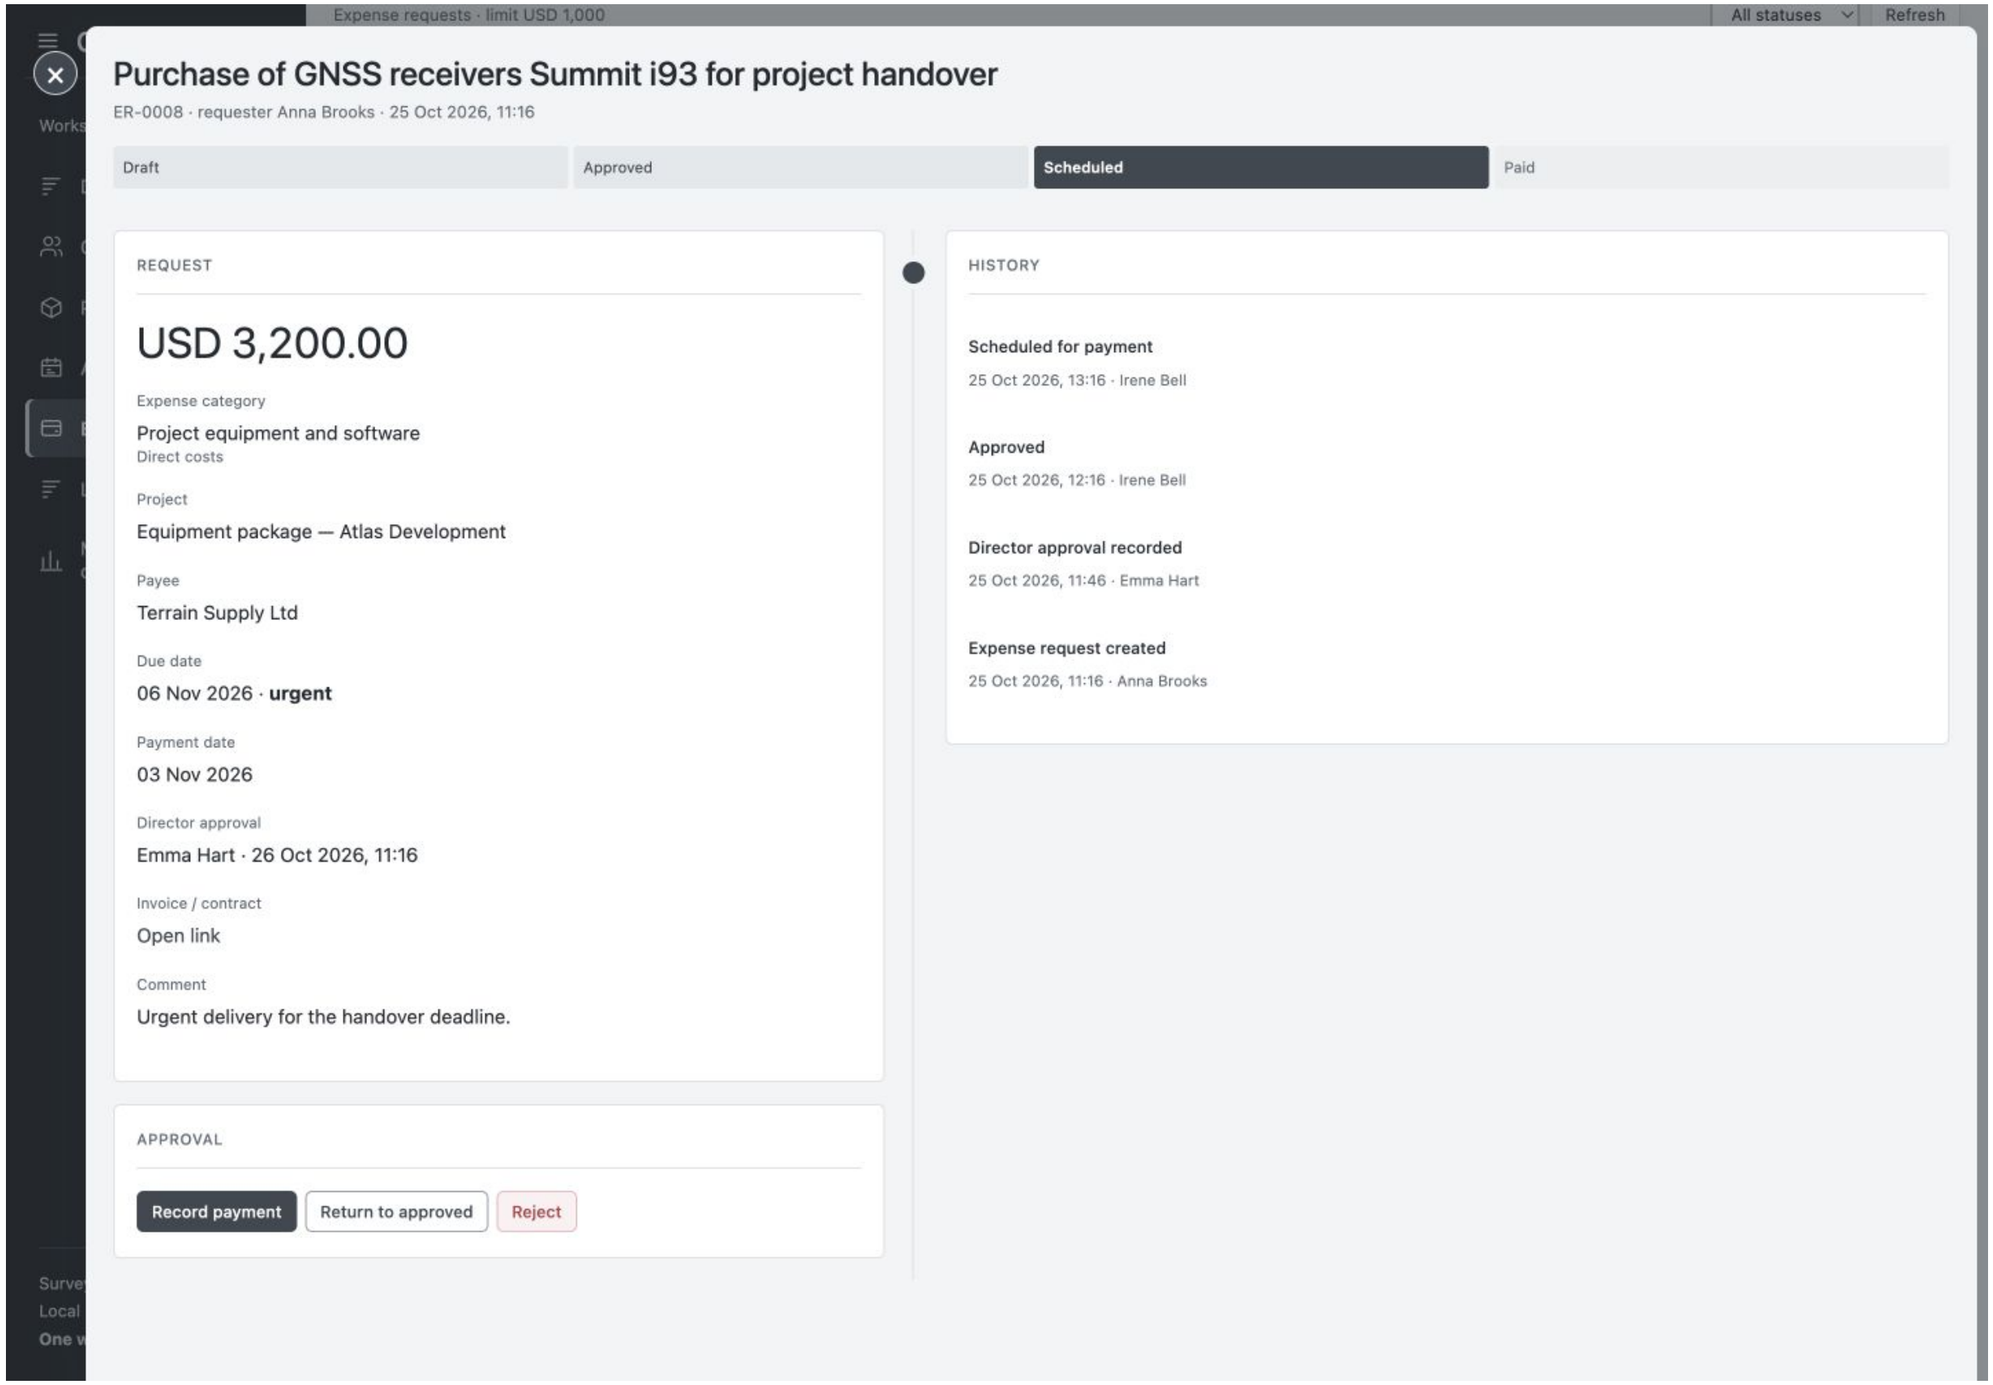

Known bounds: R01 linked-deal reference disclosure, R02 incomplete return comments and R03 self-approval policy remain documented. This guide does not certify those behaviours as resolved. Final human acceptance is pending.

Appendix. Reference model and document status

Input/output	Bundled snapshot
Horizon / sources	2 Nov 2026-31 Jan 2027; 91 days; 13 weeks; 35 included sources.
Opening / reserve	USD 15,000 / USD 2,000.
Baseline minimum	USD 7,950; no gap.
30-day delay	Minimum -USD 8,850; first gap 20 Nov 2026.
Conditional funding	USD 8,850 to zero; USD 10,850 to reserve.
Saved data	Both retained forecasts reproduce exactly after USD transformation.

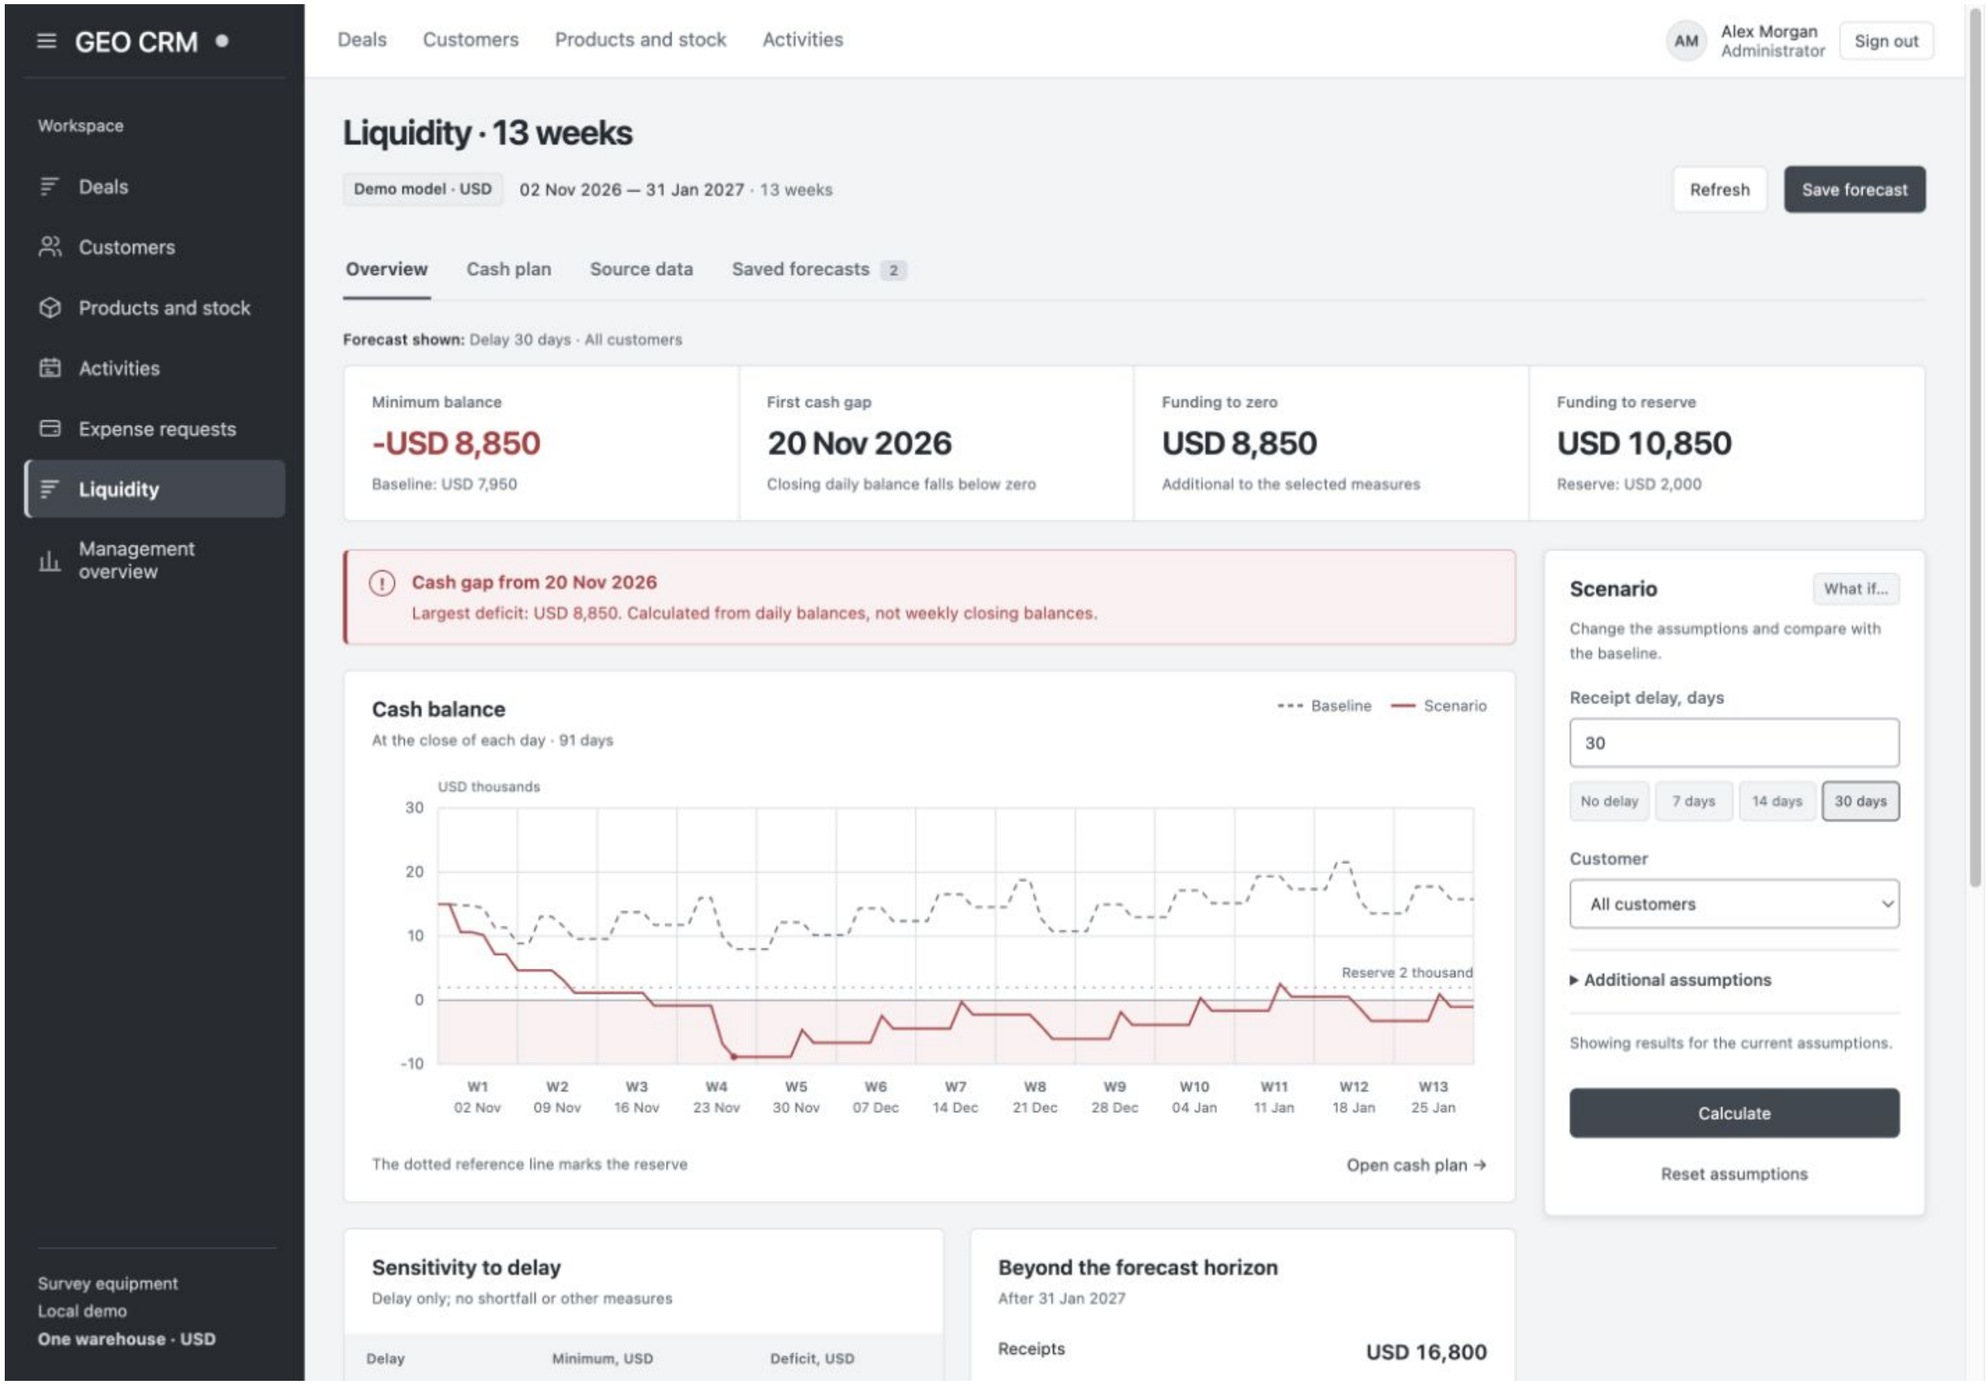

Document revision 2.0,6 November 2026, covers 1.4.0-demo. Source identity and fresh checks are in SOURCE_STATE.json and REPORT_EN.md.36 tests passed; independent daily/weekly arithmetic and restart checked. Instructions reflect the current application; no formal standard-conformity or human process acceptance is asserted.

Plate. Expense workflow

Actual request ER-0008, administrator view. Actions available to a role depend on its permissions and request state.

Plate. Liquidity overview

Retained synthetic model: 30-day receipt delay, USD 8,850 gap; actual native in-app-browser capture.
