Start here

Finance user guide, GEO CRM 1.4.0-demo, International English/USD. Prepared with the user-information approach of ISO/IEC/IEEE 26514 and four Diátaxis needs: tutorial, how-to, reference and explanation. This is an adaptation for a local demo, not a conformity audit.

Need	Where to start
Learn the model	Tutorial: inspect one request and compare cash scenarios.
Complete a task	How-to instructions for applicants, finance and accounting.
Check an exact rule	Reference: role, state, threshold, dates and sources.
Understand the numbers	Explanation: daily versus weekly cash and conditional measures.

Use the local application at http://localhost: 8765. Credentials and installation are in application/README.md. The bundled data is fictional. Existing data stays intact; a clean snapshot installer refuses populated databases.

I. Tutorial: inspect an expense and its cash impact

Sign in with a financial role. Open Expense requests and inspect the retained GNSS receivers request ER-0008. Observe USD 3,200, Scheduled state, due date, director approval and payment date. It is an existing source obligation; do not add it again as a manual payment.

Open Liquidity -> Source data. Confirm opening cash USD 15,000 and reserve USD 2,000, horizon 2 Nov 2026-31 Jan 2027. The default included set has 35 source keys. Expected receipts are independent planned cash flows, not the sum of all deals.

On Overview select No delay -> Calculate. Minimum cash should be USD 7,950 and no gap for these unmodified inputs. Select 30 days -> Calculate. Minimum becomes -USD 8,850; first gap 20 Nov 2026; funding to zero USD 8,850.

Open Cash plan, choose W 11 (11 Jan 2027-17 Jan 2027). Negative days reach -USD 1,650 while weekly closing is +USD 550. This is why the warning uses daily balances. On Overview, conditional funding USD 8,850 raises the minimum to zero; target reserve requires USD 10,850.

Open Saved forecasts and the retained 30-day snapshot. Inspect its captured input/result. Return to current model when finished. This inspection changes no business records. If you edit inputs for your own tutorial, use a separate installed copy; exact figures change with inputs and dates.

II. How-to: manage expense requests

Applicant: choose Create request. Enter a clear title, positive USD amount, category, payee, date and document link. Select the deal if the category requires a project. Review whether the request is urgent. Save, reopen and confirm the draft and history.

Director: for an amount strictly above USD 1,000, record the separate director approval. Finance director: approve, then schedule for payment. Inspect the proposed Tuesday date, or Tuesday/Thursday when urgent. The 10: 00 local-server cut-off determines the next eligible date.

Accountant: open the scheduled request and Record payment only for the intended manually entered payment fact. Verify Paid and history. No bank transfer occurs. To reconsider a scheduled request, use Return to approved if available, then check state; existing return-comment persistence is incomplete.

To find a request, use section search and Request status filter. Inspect author, linked project, payee, approval and history in its record. Access varies by role; applicants work with their own requests. Known linked-deal reference disclosure is recorded as R 01, so this demo is not a proof of full confidentiality.

Rejection and return are different: Rejected removes the obligation from open forecast inputs; returning to Approved keeps it an open obligation with its due date as the forecast date. Self-approval policy remains an open owner decision.

II. How-to: model and keep scenarios

Maintain inputs: finance director/admin opens Source data. Set forecast start, cash before day-one flows and reserve. Add planned receipts with customer/date/amount/source, and only separate payments not already represented by requests.

Model a delay: choose all customers or a specific customer, enter delay, then Calculate. A control change alone does not recalculate. Compare baseline, daily minimum and gap date. Open Cash plan to investigate the day and source responsible.

Model other assumptions: receipt shortfall changes the amount; delay changes the date. Optional-payment deferral applies only to eligible manual payments. Opening funding adds a conditional cash injection. None changes deals, approvals, bank cash or contracts.

Save: use Save forecast, enter a meaningful name and confirm. Open under Saved forecasts. Inputs and result are stored together; later current-plan edits do not rewrite it. Return with Back to current model. The USD migration has relabelled historic currency text while retaining exact numeric results and snapshot identities.

Troubleshoot: if the result looks stale, select Calculate; if a payment is duplicated, reconcile source obligations before editing; if a role is denied, use an authorised role. Preserve observed inputs and errors for review.

III. Reference: rules, fields and states

Item	Meaning
Currency / dates	USD; 2 decimal places; dates such as 6 Nov 2026. Native date-input presentation may follow browser locale.
Threshold	Strictly above USD 1,000 needs director approval first. Exactly 1,000 is within the boundary.
Payment planning	Tuesday normal; Tuesday/Thursday urgent; 10: 00 local-server cut-off. Not a bank or early-recording gate.
Request states	Draft -> Approved -> Scheduled -> Paid; Rejected separately; return can move Scheduled back to Approved.
Default inclusion	Approved: due date; Scheduled: payment date; Paid/Rejected excluded; Draft optional and labelled.
Manual flows	Only Planned included; settled/cancelled excluded. Avoid duplicate obligations.
Roles	Financial roles model/save; only finance director/admin edit liquidity inputs.
Snapshot	Captured inputs/result, actor/time; immutable under normal operation.

A single warehouse, one pipeline and USD remain the demo scope. There is no bank/accounting integration, file upload or currency exchange. Invoice/contract attachments are links.

IV. Explanation and evidence

Cash is a dated flow, not the value of a deal. Daily closing cash equals previous closing cash plus receipts minus payments. Open overdue flows are assumed on day one and disclosed. Weeks aggregate seven days; a late-week receipt can hide an earlier gap if one reads only the week close.

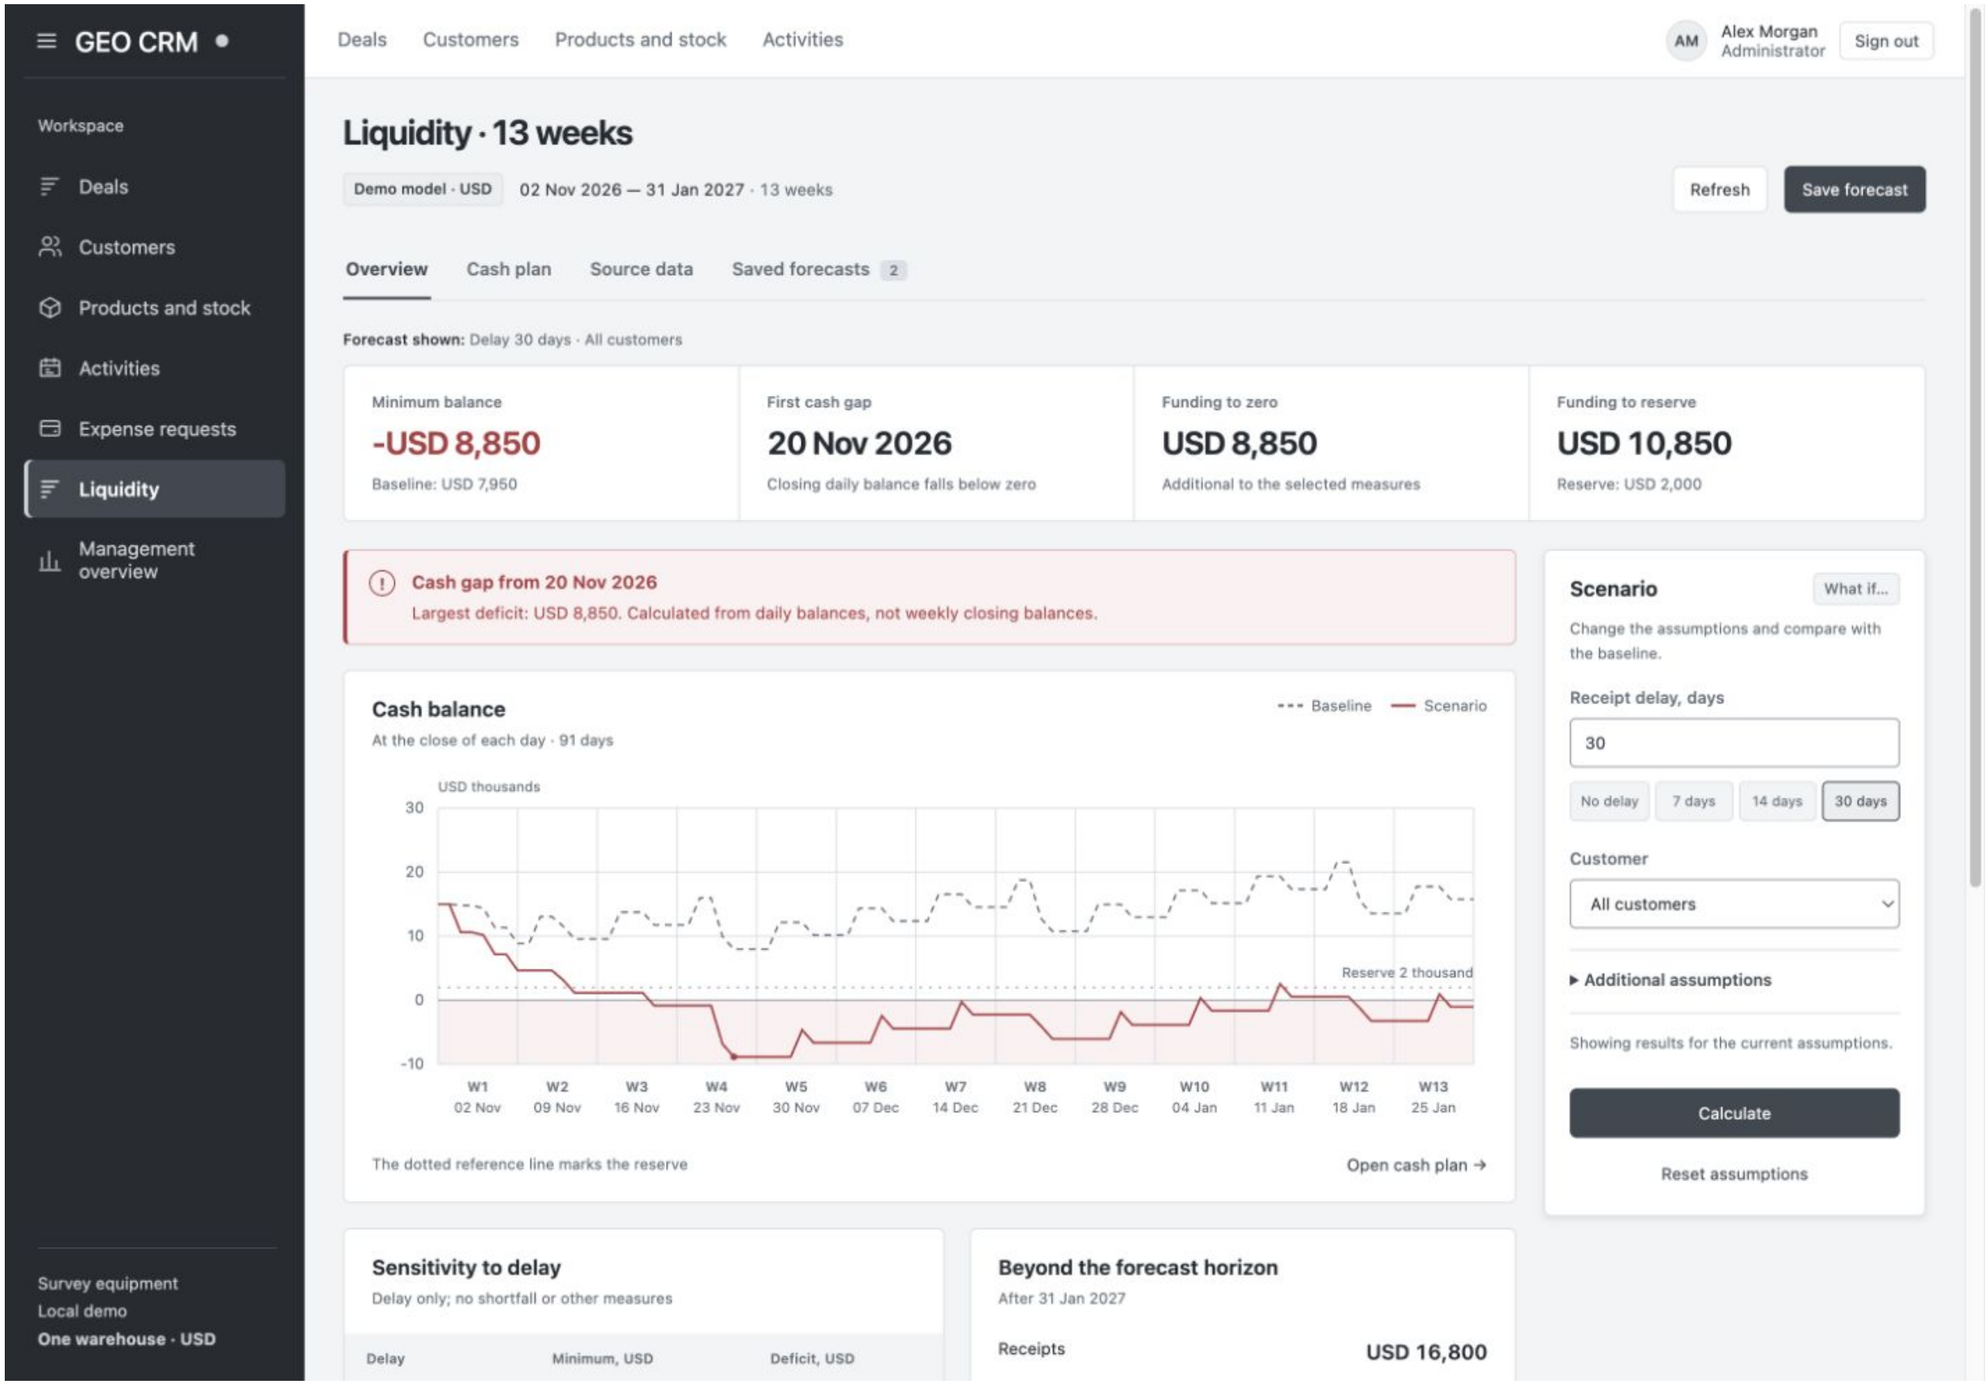

Minimum cash is the lowest of opening cash and daily closings. Funding to zero is the positive amount needed to lift that minimum to zero; funding to reserve lifts it to the selected buffer. They are conditional requirements, not an offer of credit, repayment schedule or verified finance source.

A receipt shifted after day 91 is beyond the horizon, not lost. Haircut is a separate reduction assumption. The model does not know the order of payments within a day, future certainty, FX, interest or bank truth. Recording a payment removes the open request but does not automatically reconcile the opening cash assumption.

Current verification: 36 tests, independent 182 daily rows/26 weekly aggregates/91 funded shifts, full 19-table restart and exact reproduction of both saved forecasts. This evidence supports the stated input set and configuration, not every business edge case. R 01/R 02 and the R03 policy question remain outside this release change.

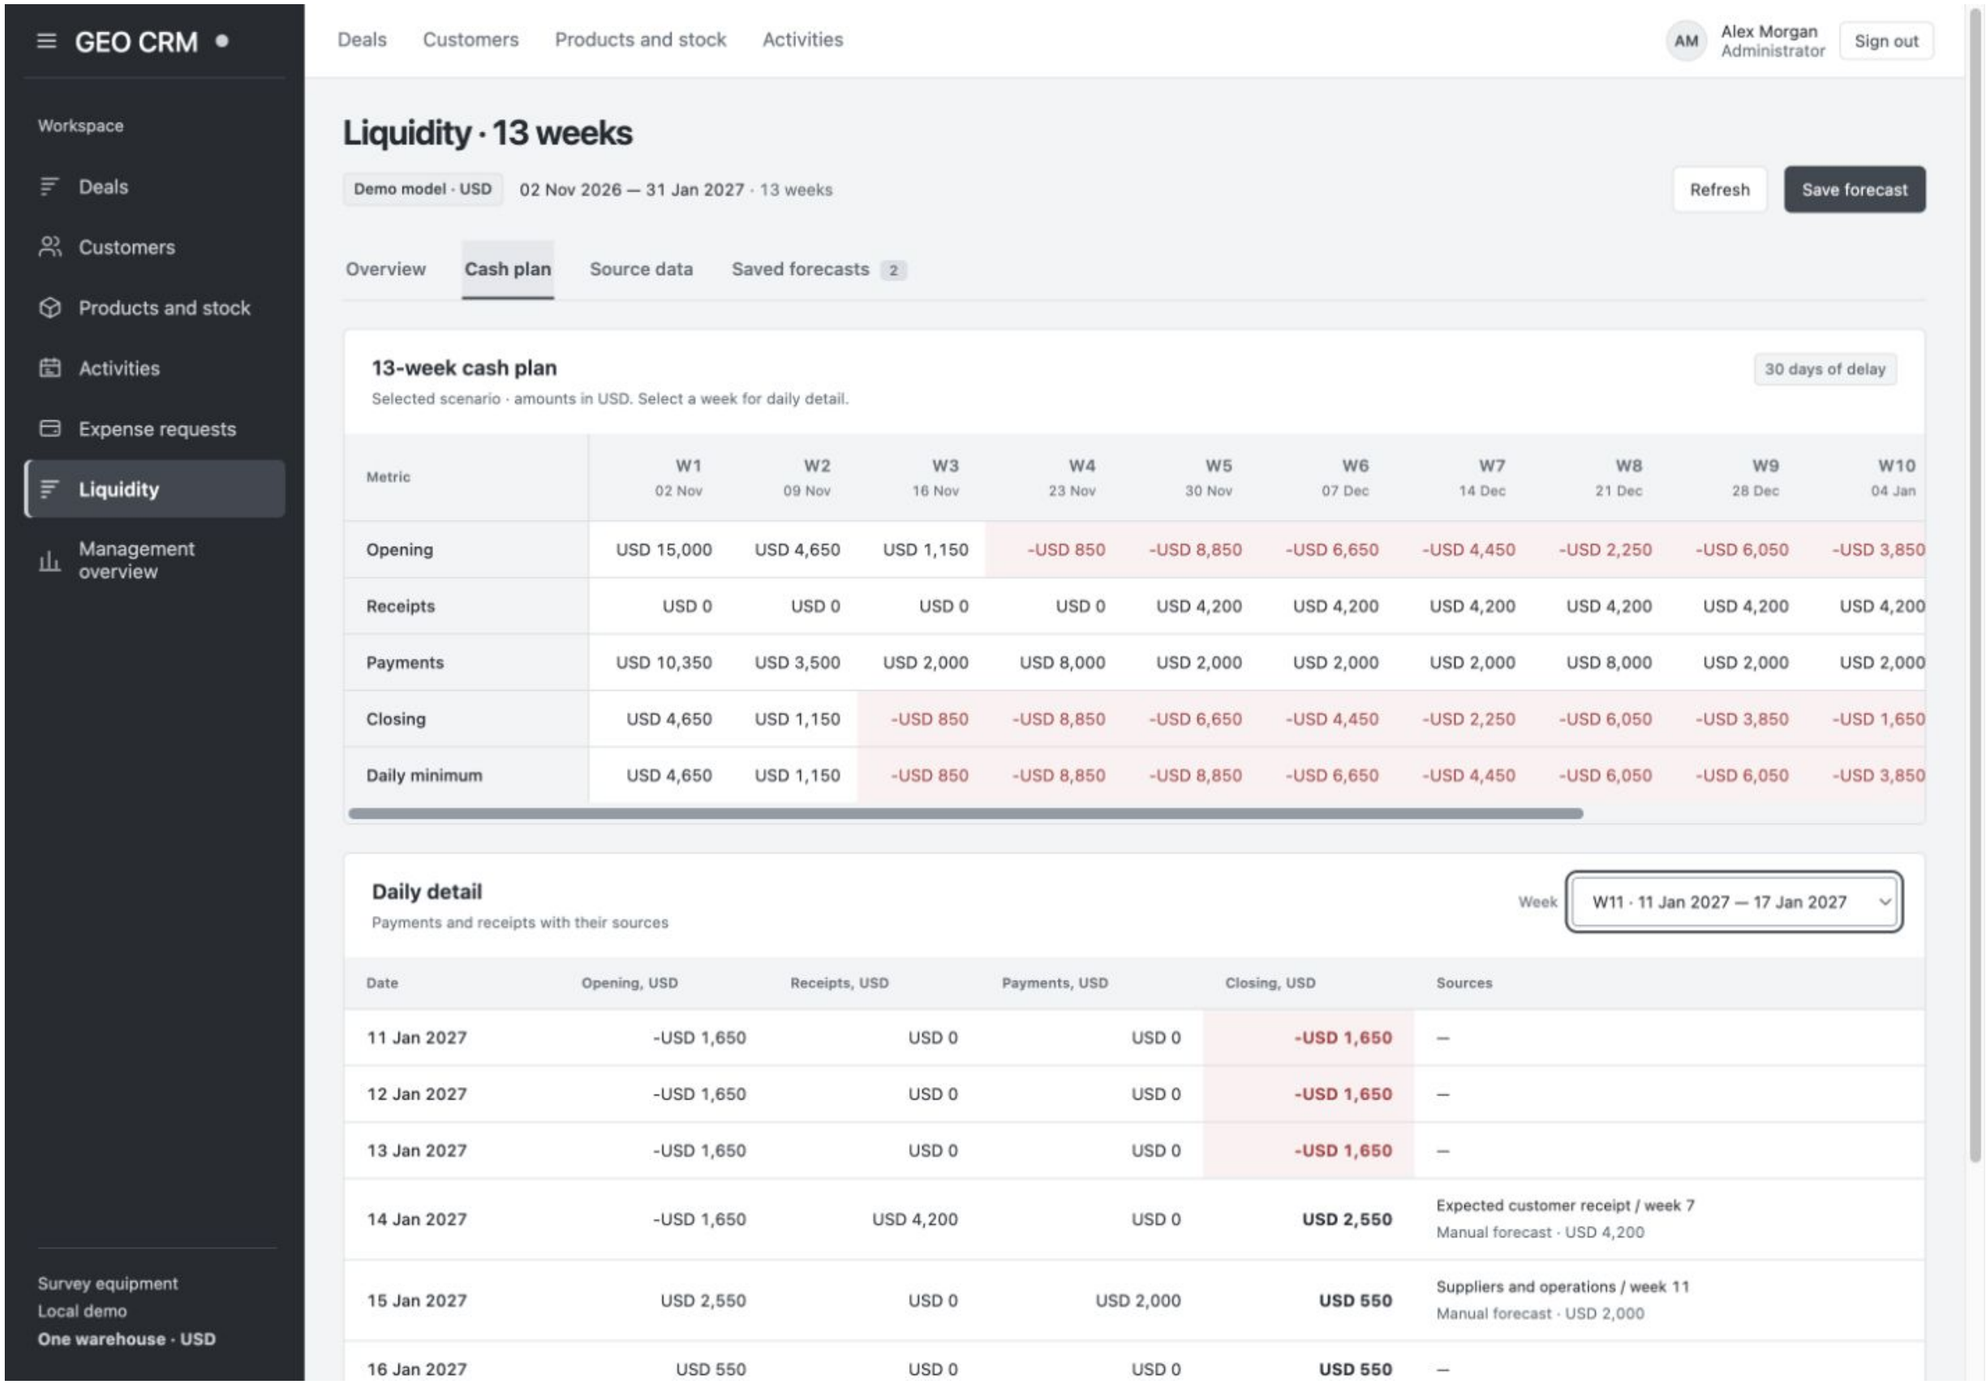

Revision 2.0,6 November 2026, application 1.4.0-demo. Final human acceptance is pending. Use REPORT_EN.md and SOURCE_STATE.json for evidence, source identity and limits.

Plate.30-day stress model

Actual current UI. USD 8,850 is a modelled funding need, not a bank transaction.

Plate. Daily detail

Week 11 has a positive closing balance but negative daily cash. Follow the individual sources.
